(5) Proposal Abstract :

Only two AGN are known to emit gamma-rays above 300 GeV – Mkn 421 and Mkn 501. The former is a weak EGRET source and the latter has not been detected by EGRET. The parsec-scale jet in Mkn 501 is almost orthogonal (on the plane of the sky) to the kiloparsec-scale jet, and there is some evidence that the same may be true for Mkn 421. We propose to make 5 GHz images of these two BL Lac objects during their atmospheric Cerenkov observing season to examine ‘orthogonal jet’ models, and search for possible correlations between the VLBI structures and TeV activity.

(13) Details of proposed experiments

An 'experiment' is one or more observations of one source in one wavelength band.

A request to observe the same source in all 3 wavelength bands requires 3 columns to be filled in.

To observe the same source at the same frequency multiple times – a 'monitoring experiment' – requires only one column to be filled in.

Number of experiments in this proposal: 2
